signaling activity o G alpha subunits a increasing the rate allows the G alpha heterodimers, form terminating the sig this gene have bee	e RGS domain. The protein attenuates the f G-proteins by binding to activated, GTP-bound nd acting as a GTPase activating protein (GAP), of conversion of the GTP to GDP. This hydrolysis subunits to bind G beta/gamma subunit ning inactive G-protein heterotrimers, thereby nal. Alternate transcriptional splice variants of n observed but have not been thoroughly vided by RefSeq, Jul 2008]
