Background: This gene encodes the beta subunit of casein kinase II, a ubiquitous protein kinase which

regulates metabolic pathways, signal transduction, transcription, translation, and

replication. The enzyme is composed of three subunits, alpha, alpha prime and beta, which form a tetrameric holoenzyme. The alpha and alpha prime subunits are catalytic, while the

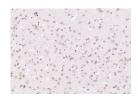

beta subunit serves regulatory functions. The enzyme localizes to the endoplasmic

reticulum and the Golgi apparatus. [provided by RefSeq, Jul 2008].
