the regulation of tra made up of four cor primary building ble histones undergoes including acetylatic modifications occur direct effect on gen is primarily acetylate 9 appears to have a chromatin assembl	hromatin structure plays an important role in inscription in eukaryotes. The nucleosome, e histone proteins (H2A, H2B, H3 and H4), is the ock of chromatin. The N-terminal tail of core different posttranslational modifications on, phosphorylation and methylation. These r in response to cell signal stimuli and have a e expression. In most species, the histone H2B red at lysines 5, 12, 15 and 20. Histone H3 is d at lysines 9, 14, 18 and 23. Acetylation at lysine dominant role in histone deposition and y in some organisms. Phosphorylation at Ser10 tly correlated with chromosome condensation and meiosis.
