Background: GM-CSF Receptor Beta is the v subunit of the heterodimeric receptor for colony stimulating factor 2, a cytokine which controls the production, differentiation, and function of granulocytes and macrophages. The encoded protein is a member of the cytokine family of receptors. This gene is found in the pseudoautosomal region (PAR) of the X and Y chromosomes. Six transcript variants encoding five different isoforms have been found for this gene, with some of the isoforms being membrane-bound and others being soluble.
