## phospho-p38 MAPK (Thr180 + Tyr182) Peptide

| Catalog Number: | bs-2210P  |
|-----------------|---|
| Activity:       | Not tested  |
| Purification:   | HPLC  |
| Storage:        | Shipped at 4°C. Stored at -20°C for one year. Avoid repeated freeze/thaw cycles.              |
| Background:     | The protein encoded by this gene is a member of the MAP kinase family. MAP kinases act as     |
|                 | an integration point for multiple biochemical signals, and are involved in a wide variety of  |
|                 | cellular processes such as proliferation, differentiation, transcription regulation and       |
|                 | development. This kinase is activated by various environmental stresses and                   |
|                 | proinflammatory cytokines. The activation requires its phosphorylation by MAP kinase          |
|                 | kinases(MKKs), or its autophosphorylation triggered by the interaction of MAP3K7IP1/TAB1      |
|                 | protein with this kinase. The substrates of this kinase include transcription regulator ATF2, |
|                 | MEF2C, and MAX, cell cycle regulator CDC25B, and tumor suppressor p53, which suggest the      |
|                 | roles of this kinase in stress related transcription and cell cycle regulation, as well as in |
|                 | genotoxic stress response. Four alternatively spliced transcript variants of this gene        |
|                 | encoding distinct isoforms have been reported.  |
|                 |   |
