Background:	The product of this gene is an epsilon subunit of coatomer protein complex. Coatomer is a
	cytosolic protein complex that binds to dilysine motifs and reversibly associates with Golgi
	non-clathrin-coated vesicles. It is required for budding from Golgi membranes, and is
	essential for the retrograde Golgi-to-ER transport of dilysine-tagged proteins. Coatomer
	complex consists of at least the alpha, beta, beta', gamma, delta, epsilon and zeta subunits.
	Alternatively spliced transcript variants encoding different isoforms have been identified.
