AMPK is mechanism involvi phosphorylation b kinase and inhibiti phosphorylate and reductase and ace enzymes of sterol s The human AMPKa and 552 amino aci encodes a 271 ami 272 amino acid protein and 492 amino acid	imeric complex comprising a catalytic a subur nd g subunits. It protects cells from stresses th on by switching off ATP-consuming biosynthet activated by high AMP and low ATP through a ing allosteric regulation, promotion of y an upstream protein kinase known as AMPK on of dephosphorylation. Activated AMPK can I regulate in vivo hydroxy-methylglutaryl-CoA tyl-CoA carboxylase, which are key regulatory synthesis and fatty acid synthesis, respectively 1 and AMPKa2 genes encode 548 amino acid d proteins, respectively. Human AMPKb1 no acid protein and human AMPKb2 encodes a otein. The human AMPKg1 gene encodes a 331 a. Human AMPKg2 and AMPKg3, which are 569 d proteins, respectively, contain unique N- and may participate directly in the binding of PK complex.	at ic
