## **Recombinant CPV VP2 protein, His**

Catalog Number:	bs-49051P
Concentration:	>0.5 mg/ml
AA Seq:	201-584/584
Predicted MW:	42
Tags:	His
Activity:	Not tested
Endotoxin:	Not analyzed
Purity:	>95% as determined by SDS-PAGE
Purification:	AC
Form:	Lyophilized or Liquid
Storage:	10mM Tris-HCl (pH8.0) with 150mM NaCl.
	Stored at -70°C or -20°C. Avoid repeated freeze/thaw cycles.
Background:	Capsid protein self-assembles to form an icosahedral capsid with a T=1 symmetry, about 22
	nm in diameter, and consisting of 60 copies of two size variants of the capsid proteins, VP1
	and VP2, which differ by the presence of an N-terminal extension in the minor protein VP1.
	The capsid encapsulates the genomic ssDNA. Capsid proteins are responsible for the
	attachment to host cell receptor TFRC. This attachment induces virion internalization
	predominantly through clathrin-endocytosis. Binding to the host receptors also induces
	capsid rearrangements leading to surface exposure of VP1 N-terminus, specifically its
	phospholipase A2-like region and nuclear localization signal(s). VP1 N-terminus might serve
	as a lipolytic enzyme to breach the endosomal membrane during entry into host cell.
	Intracytoplasmic transport involves microtubules and interaction between capsid proteins
	and host dynein. Exposure of nuclear localization signal probably allows nuclear import of
	capsids.
