Background:	It is a bactericidal agent. The bactericidal activity of enrofloxacin is concentration-
	dependent, with susceptible bacteria cell death occurring within 20–30 minutes of exposure.
	Enrofloxacin has demonstrated a significant post-antibiotic effect for both Gram-negative
	and Gram-positive bacteria and is active in both stationary and growth phases of bacterial
	replication. Enrofloxacin is partially deethylated by CYP450 into the active metabolite
	ciprofloxacin, which is also a fluoroquinolone antibiotic, used preferentially in humans.
