| Background: | This gene is a member of the NGF-beta family and encodes a secreted protein which |
| | homodimerizes and is incorporated into a larger complex. This protein has nerve growth |
| | stimulating activity and the complex is involved in the regulation of growth and the |
| | differentiation of sympathetic and certain sensory neurons. Mutations in this gene have |
| | been associated with hereditary sensory and autonomic neuropathy, type 5 (HSAN5), and |
| | dysregulation of this gene's expression is associated with allergic rhinitis. [provided by |
