TMEM74 Antibody Blocking Peptide

Catalog Number:	bs-9922P
Activity:	Not tested
Purification:	HPLC
Storage:	Shipped at 4°C. Stored at -20°C for one year. Avoid repeated freeze/thaw cycles.
Background:	TMEM74 is a 305 amino acid protein encoded by a gene mapping to human chromosome 8.
	Made up of nearly 146 million bases, chromosome 8 encodes about 800 genes.
	Translocation of portions of chromosome 8 with amplifications of the c-Myc gene are found
	in some leukemias and lymphomas, and typically associated with a poor prognosis. Portions
	of chromosome 8 have been linked to schizophrenia and bipolar disorder. Trisomy 8, also
	known as Warkany syndrome 2, most often results in early miscarriage but is occasionally
	seen in a mosaic form in surviving patients who suffer to a varying degree from a number of
	symptoms including retarded mental and motor development, and certain facial and
	developmental defects. WRN is a DNA helicase encoded by chromosome 8 and shown
	defective in those with the early aging disorder Werner syndrome. Chromosome 8 is also
	associated with Pfeiffer syndrome, congenital hypothyroidism and Waardenburg syndrome.
