产品介绍:	Alpha2-HS glycoprotein (AHSG), a glycoprotein present in the serum, is synthesized by
	hepatocytes. The AHSG molecule consists of two polypeptide chains, which are both
	cleaved from a proprotein encoded from a single mRNA. It is involved in several functions,
	such as endocytosis, brain development and the formation of bone tissue. The protein is
	commonly present in the cortical plate of the immature cerebral cortex and bone marrow
	hemopoietic matrix, and it has therefore been postulated that it participates in the
	development of the tissues. However, its exact significance is still obscure. [provided by
