| Background: | The protein encoded by this gene shares a significant similarity with Schizosaccharomyces |
| | pombe cdc5 gene product, which is a cell cycle regulator important for G2/M transition. This |
| | protein has been demonstrated to act as a positive regulator of cell cycle G2/M progression. |
| | It was also found to be an essential component of a non-snRNA spliceosome, which contains |
| | at least five additional protein factors and is required for the second catalytic step of pre- |
| | mRNA splicing. [provided by RefSeq, Jul 2008]. |
