Background: This gene is a member of the 3-hydroxyacyl-CoA dehydrogenase

gene family. The encoded protein functions in the mitochondrial matrix to catalyze the oxidation of straight-chain3-hydroxyacyl-CoAs as part of the beta-oxidation pathway. Its enzymatic activity is highest with medium-chain-length fatty acids. Mutations in this gene cause one form of familial hyperinsulinemic hypoglycemia. The human genome contains a related pseudogene of this gene on

chromosome 15. [provided by RefSeq.]
