Background: ZFP14 (zinc finger protein 14 homolog) is a 533 amino acid protein that localizes to the nucleus and is composed of 13 C2H2-type zinc fingers and a KRAB domain. ZFP14 is encoded by a gene located on human chromosome 19, which consists of over 63 million bases, houses approximately 1,400 genes and is recognized for having the greatest gene density of the human chromosomes. It is the genetic home for a number of immunoglobulin (Ig) superfamily members, including the killer cell and leukocyte Ig-like receptors, a number of ICAMs, the CEACAM and PSG families, and Fc receptors (FcRs).
